F. IDENTIFY FUNDING MECHANISMS

The primary pollutants Robinson Township identified as contributing to the existing pollutant loads in surface waters within the Township were Siltation, Nutrients, Organic Enrichment/Low D.O., and Suspended Solids. These pollutants were found on the DEP-provided MS4 requirements table. Robinson Township has proposed meeting the Pollutant Plan Reduction requirements through the use of street sweeping and development of existing infiltration basins located in proximity to the largest continuous impervious areas within the Township.

Street Sweeping – Performed through contractual agreement or by public works department and funded by Robinson Township.

Infiltration Basin – Performed by public works department and funded by Robinson Township.

G. IDENTIFY RESPONSIBLE PARTIES FOR OPERATION AND MAINTENANCE (O&M) OF BMP'S

- 1. Street Sweeping – Performed through contractual agreement with responsible vendor or by public works department.**

Operation and Maintenance

I. Introduction

Robinson Township believes it is in the best interest of the residents of the Community to perform street sweeping on a regular schedule throughout the year. Reasonable sweeping is necessary for vehicle and pedestrian safety, water quality issues and environmental concerns. The Township will provide such service in a cost-effective manner, keeping in mind safety, budget, personnel and environmental concerns. The Township will use public works employees, equipment and/or private contractors to provide this service. Completion dates are depended on weather conditions, personnel and equipment availability. The Public Works Superintendent or his designee will be responsible for scheduling of personnel and equipment.

II. Schedule of Street Sweeping

- A. Goal of 25 times per year
- B. Spring sweeping of snow and ice control aggregate will begin when streets are significantly clear of snow and ice, usually late March or early April, after the risk of later snowfall has passed. Spring sweeping is typically completed by June 21.
- C. Summer sweeping will begin immediately after spring sweeping and prioritize newly treated roads throughout the Township to remove construction related debris.
- D. Sealcoating is a surface application of an asphalt emulsion followed by a layer of small rock that protects the pavement from the deteriorating effects of sun and water plus it provide increased surface friction. Sealcoat sweeping will commence 2 days after application of sealcoat and will be completed within 5 days of application.
- E. Fall sweeping will commence September 15 and typically is completed by November 31. Areas with extensive foliage will be swept after most of the leaves have fallen.
- F. Storm Water Quality areas will be swept on a priority basis throughout the year.
- G. Environmental/general sweeping will be performed on a routine basis.
- H. Bituminous milling recovery sweeping will be performed within 10 days of grinding, milling or crack sealing operations.
- I. Erosion/siltation dirt and debris cleanup from construction projects is the responsibility of the developer, contractor or property owner. Except in cases of emergency the streets shall be cleaned and swept within 5 days of notification. If the streets are not swept within the specified time allowed or in the case of an emergency the Township may sweep the street and the responsible party will reimburse the Township for any associated cost.
- J. Tree trimming and pruning areas will be swept within 10 days of the operation.
- K. Citizen requests for sweeping will be evaluated and the Public Works Superintendent will determine the priority.

III. Street Sweeping Procedures

Street sweeping is a slow process with average gutter line speeds for the first sweeping in spring that can be as slow as 2 to 3 miles per hour. The Township will sweep with its own equipment and manpower, or contract services. Normally center lines are swept after gutter lines are cleaned. Equipment may include mechanical, vacuum or regenerative air sweepers.

IV. Priorities

The Township has classified Township streets based on the street function, traffic volume, impact on water quality and the environment, and the importance to the welfare of the Community. Accordingly, sweeping routes will be designed to provide the maximum possible benefit to higher volume and water quality sensitive areas.

V. Weather Conditions

Sweeping operations will be conducted when weather conditions permit. Factors that may delay sweeping operations include: temperatures below 32 degrees, wind, rain, snow and frozen gutter lines.

VI. Work Schedule

Sweeping operations are performed in conjunction with and can be impacted by other maintenance operations. Sweeping operations will normally be conducted Monday through Thursday from 7:00 AM to 4:30 PM. Extended workdays and shift changes may be utilized for spring cleanup or emergency sweeping to provide maximum efficiency. For safety reasons, no operator shall work more than a twelve-hour shift in any twenty-four hour period.

VII. Safety

Sand, sealcoat rock or other dirt and debris on the street can create a potentially dangerous condition for vehicles, motorcyclists, bicyclists and pedestrians. It would not be practical or effective to sign all streets for potential dangerous conditions. During sealcoat or milling operations, warning signs indication loose rock will be placed on each end of collector and arterial streets or other appropriate areas where needed. These signs will remain in place until the street has been swept. Employees will follow all work rules, OSHA regulations and Federal and State laws to ensure a safe sweeping operation.

2. Infiltration Basin Development – Performed by Public Works department with guidance from Township Engineer.

Many existing stormwater detention and retention basins in Robinson Township were built prior

to formulation of the Township MS4 program and were designed with the single purpose of providing flood control. These basins function by capturing stormwater from rain events and slowly infiltrate or release this water to a receiving stream or stormwater channel. This action effectively mitigates flooding and decreases flow to MS4 outfalls by both decreasing peak flows downstream and delaying the timing of those peaks. Particularly in densely populated areas, it has been suggested that this style of basin could be improved to contribute to green infrastructure and pollutant reduction goals.

Robinson Township has identified the most extensive areas within the Township that have the highest potential for transmitting the primary pollutants identified by DEP in Appendix E of the MS4 requirements table. These areas are believed to contribute the highest levels of nutrient and sediment loading to surface waters resulting in organic enrichment, low D.O. and high siltation levels. *By retrofitting existing retention and detention basins in these priority areas to handle a higher volume of stormwater, significantly reduced levels of the primary pollutants identified in Appendix E would be mitigated.* Furthermore, because PA DEP scrutinizes the level of feasibility in the Township Pollutant Reduction Plan, the Township believes that the relatively minor excavation operations involved in increasing the volume of existing retention and detention basins combined with vegetation implantation will be significantly less cost prohibitive than other methods of pollutant reduction.

Operation and Maintenance

I. Limitations of traditional detention/retention basins

1. Traditional basins often have a reduced ability of basins to infiltrate water due to compacted soil. Compacted soil makes it harder for stormwater to enter the soil, so more water moves down the slope as runoff, carrying nutrients and sediments may form ponding on the surface. Retrofitting existing basins will have the added effect of aerating existing soil in the basin to increase infiltration.
2. The inability of basins to treat small runoff events. Since dry detention basins often contain a concrete low flow channel, runoff from smaller storms typically flows directly through the basin without treatment. Although concrete low flow channels were intended to minimize habitat for mosquito breeding by eliminating small pools of standing water, these channels also limit infiltration during small storms. Given that 90% of the storms in Pittsburgh are less than 1.25 inches of rainfall, a significant volume of water passes through these basins without treatment or the opportunity to infiltrate into the basin soil.

These limitations may be overcome by modifying the basin to allow more water to spread beyond the concrete channel and by planting native or other deep-rooted herbaceous vegetation. Such vegetation can improve the infiltration and filtration (pollutant removal) of stormwater runoff. Furthermore, such vegetation reduces mowing and maintenance frequency saving Robinson Township a portion of the cost to initially implement this method, thus increasing feasibility.

II. Responsible Parties

Detention and retention basins are typically owned by the municipality as community property.

III. Increasing Volume

A good basin to modify within the Township would be those that have short vegetation, a low flow concrete channel, a discharge orifice greater than 3 inches and is not used for other purposes when dry. It is also important to consider the depth to groundwater where the basin is sited so that the potential infiltration is maximized. One of the main goal with modifying a basin is to get more of the stormwater runoff to spread out across the basin bottom to increase infiltration and filtration by the vegetation.

Successful modification and increase of volume can be accomplished by one or more of the following methods:

1. Removing the concrete low flow channel and replacing it with vegetation or stone.
2. Placing a structure across the channel to deflect the stormwater out into the basin.
3. Modifying the outlet structure.
4. Further excavation of basin

IV. Maintenance

Instead of weekly or bi-weekly mowing, properly modified basins need only be mowed once a year, preferably in late fall after the first frost. By not mowing during the growing season, the mature vegetation can improve wildlife habitat and provide ecological benefits. Allowing the vegetation to grow and flower will enable further infiltration. Sediment accumulation in the basin may be allowed, but should be evaluated on a site-by-site basis to ensure that the flood control capabilities of the basin remain intact.

The desired result of a successful detention/retention basin modification is to slow down stormwater runoff and provide the time and space for the water to infiltrate into the ground, while providing necessary flood protection. Native vegetation can allow a site to serve as a place for environmental education while providing the local community with increased ecosystem diversity.

An additional benefit of the basin modification is the potential maintenance cost savings due to reduced mowing schedules and reduced consumption of resources for mowing. These savings can be substantial for Robinson Township.

Appendix D – Ohio River Storm Sewershed

In conformance with DEP document 3800-PM-BCW0100d, Appendix B: Pollutant Control Measures for Waters Impaired By Pathogens and as noted in the MS4 Requirements table, please find attached a Map and Inventory as required. The portion of the Ohio River sewershed in Robinson Township contains tributary surface waters which flow to the Ohio River and it has been determined by DEP that there may contain illicit sources contributing to pathogens (e.g., Fecal Coliform). Robinson Township has inspected all outfalls along the tributary area for these surface waters that flow to the Ohio River and did not discover any potential sources of fecal coliform.

In compliance with the requirements for Appendix B, the following documents have been attached to this plan:

1. Map
2. Outfall Inventory
3. Inspection documentation of potential illicit outfalls
4. Documentation of Robinson Township Stormwater management ordinance

Appendix D – Ohio River Storm Sewershed

In conformance with DEP document 3800-PM-BCW0100d, Appendix C: Pollutant Control Measures for Waters Impaired By Priority Organic Compounds and as noted in the MS4 Requirements table, please find attached a Map and Inventory as required. The portion of the Ohio River sewershed in Robinson Township contains tributary surface waters which flow to the Ohio River and it has been determined by DEP that there may contain illicit sources contributing to priority organic compounds including but not limited to polychlorinated Biphenyls (PCB's), Pesticides and other organic compounds listed at 40 CFR Part 423, Appendix A. Robinson Township has inspected all outfalls along the tributary area for these surface waters that flow to the Ohio River and did not discover any potential sources of Priority Organic Compounds.

In compliance with the requirements for Appendix C, the following documents have been attached to this plan:

1. Map
2. Outfall Inventory
3. Inspection documentation of potential illicit outfalls

Appendix E – Public Participation Advertisement

PUBLIC NOTICE Robinson Township has created a Pollutant Reduction Plan (PRP) to meet the requirements of its Municipal Separate Storm Sewer (MS4) permit with the Department of Environmental Protection (DEP). The PRP includes estimates of the existing pollutants that are discharged to Township streams and the reductions that are required by DEP. The plan also identifies proposed stormwater improvements needed to meet these pollutant reduction requirements. Possible funding sources and ongoing operation and maintenance responsibilities for the proposed stormwater improvements are included in the PRP. A draft of the PRP will be available for public inspection at the Township office located at 1000 Church Hill Road, Pittsburgh, PA 15205 Monday through Friday between the hours of 8 am and 4 pm. A copy is also available at www.townshipofrobinson.com. The public review period will begin on July 28, 2017, and will continue for 30 days until August 27, 2017. During this period, comments must be submitted in writing to the Township. Comments can also be made during the public comment period at Township Council meetings.
